

# Humidity Absorber In chain (6 boxes with hook)

Considering high temperature variations between inside and outside container, considering closed atmosphere, lack of ventilation and final destinations, the real need is in protecting your goods from humidity falling from roof (to avoid, for instance, rusted cans, tried clothes, unstuck labels of wine, waterlogged boxes or packaging...).

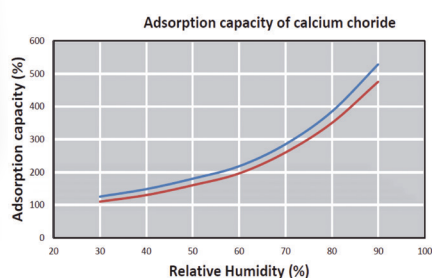

This kind of desiccant has been developed in order to neutralize condensate formation inside maritime containers. They have a great power of absorption, until 4 times its original weight, and are really easy to use and install (one hook to pass inside upper lashing rings and then the chain is vertically falling along the container side, inside a corrugation to keep full your loading space).

Recommendation for normal use conditions :

- 5 chains of 6 boxes for a 20ft container
- 10 chains of 6 boxes for a 40ft container

For very long maritime trips and/or very sensitive products to humidity, we recommend you to double quantities to reinforce absorber efficiency.

Storage conditions : fresh and dry place, keeping dosed the plastic protection.

Product composition :

- Calcium chloride and minerals mixture
- Breathable membrane

How it works :

- humidity is attracted by the mixture through the breathable membrane ,  
=> transformed in water,  
=> contained inside the box.

Once captured, the humidity (restraint by the membrane) cannot evaporate any more in the air.

Free from DMF-Dimethyl Fumarate.

- Packaging: 5 chains of 6 boxes inside 1 box
